This operating manual contains important technical information and guidance on proper use of the product. Please read the manual before using ST 400 Cayman.

1. Description

1.1. Purpose

ST 400 Cayman is intended to detect and locate

- eavesdropping electronics
- mobile phones and SIM cards
- any other devices utilising semiconductor technology

ST 400 Cayman allows detecting electronic devices, whether active or not, as well as finding their exact location. It also enables one to distinguish between return signals from real semiconductors and other kinds of responses, such as those given by corrosion or metal-oxide-metal structures.

1.2. Delivery package

ST 400 Cayman comes in a shockproof case that contains the following.

Item	Quantity	No. in Fig. 1
ST 400 'Cayman' NLJD	1	2
Accumulator Battery (type 18650)	2	3
Charger Power Adapter	1	4
Electric Charger	1	5*
Headphones	1	6*
Semiconductor Imitating Dummy (marked red)	1	1
MOM-Structure Imitating Dummy (marked blue)	1	1
Operating Manual	1	not shown in fig.
Case	1	not shown in fig.

*The electric charger and headphones are lodged at the bottom, underneath the device.

Fig. 1

1.3. Main Technical Specifications

Range of radiated frequencies	2–3GHz
Max. peak radiated power	< 2W
Antenna polarisation	elliptic
Operation modes	SEARCH
	AUDIO
	ADAPT
Sensitivity range in manual mode	40dB (5 values with 8dB increment)
Response indication	
– visual	three 16-segment LED gauge bars
– aural	internal speaker or headphones
Power supply	two 3.7V rechargeable Li-ion batteries (type 18650)
Time of operation on one battery charge	3-4 hours, depending on the operation mode
Battery charging time	< 3 hours
Operating conditions	
– working temperature range	+5...+40°C
– relative air humidity	up to 85 percent (at 25°C)
Weight (with batteries)	1,75kg
Dimensions (length×width×height)	
– when folded	510x145x130mm
– with telescopic arm pulled out completely	1500x250x130mm
Weight of full set in case	5,8kg

1.4. Principles of Operation

ST 400 Cayman is a nonlinear junction detector, or NLJD. Instruments of this type employ active detection, i.e. they emit probing signals and analyze the return. Their primary search targets are electronic devices, and those typically consist of circuit plates with conductive elements and various semiconductor parts connected to them, such as diodes, transistors, and microchips. The probing electromagnetic radiation induces variable electromotive forces in these loops, and electronic components with a non-linear current-voltage curve transform the initial signal into its higher frequency harmonics, which come back to the NLJD’s receiver.

Higher harmonics can also be re-radiated by corroded metal or the so-called MOM-diodes, metal-oxide-metal structures brought about by contacting metal surfaces. However, these formations return somewhat different spectra than semiconductors.

With ST 400 Cayman one can distinguish with high probability between responses given by real semiconductors, and those ‘faked’ by MOM-structures or corrosion. Another important advantage is a confident detection of search targets behind partially shielding obstacles, which is achieved by simultaneously radiating several frequencies within the 2-3GHz band and analyzing the composite picture of the reflection spectrum.

1.5. Operation Modes

The NLJD ST 400 Cayman has the following modes of operation:

Primary operation mode: SEARCH

Secondary operation mode: AUDIO

Service mode: ADAPT

The main operation mode named SEARCH is meant for detecting nonlinear targets and identifying them, based on the response levels as indicated by 16-segment bars.

The auxiliary operation mode named AUDIO allows demodulating the response and listening to it through the built-in speaker or headphones. Use this mode upon detecting a response in the SEARCH mode.

The ADAPT service mode is used to optimise the parameters in a given electromagnetic environment and thus maximise the effectiveness of search. Engaging this mode is necessary every time the device is switched on. It is advisable to pause during searches from time to time, to repeat this procedure. During adaptation, the antenna must be pointed away from electronics and large metal objects.

1.6. Structure

Structurally, the ST 400 Cayman NLJD consists of the main unit and antenna module, that are connected with a telescopic arm. The main constituents are shown in Fig. 2.

Fig. 2

The numbers in Fig. 2 stand for:

- | | |
|---------------------------------------|----------------------------|
| 1 – antenna module | 11 – headphone socket |
| 2 – main unit | 12 – power and volume knob |
| 3 – battery compartment | 13 – ID plate |
| 4 – battery compartment cap | 14 – inbuilt speaker |
| 5 – handle | 15 – controls |
| 6 – antenna module bracket | |
| 7 – lever handle of the clamp | |
| 8 – power-and-control cable with plug | |
| 9 – cam clamps of the telescopic arm | |
| 10 – telescopic arm | |

1.6.1. Antenna module

The antenna module comprises a receiver-transmitter unit, a control-display unit, and an aerial, all of which are assembled on a single platform and incorporated in a single body. The antenna is mounted at the end of a telescopic arm by way of a hinge joint that allows adjusting the incline within the vertical plane along the rod's axis, as shown in Fig. 3. To change the incline, unlock the clamp by turning its handle counter-clockwise, as shown in Fig. 3, then adjust and lock by turning the clamp handle in the clockwise direction.

Fig. 3

Do not try to change the antenna incline with the clamp locked: you may break the hinge joint!

Fig. 4

On the antenna surface facing the operator, there are an indicator panel, a socket for the power-and-control cable, and a USB port for computer connection (Fig. 4).

The numbers in Fig. 4 stand for the following:

# in Fig. 4	description	colour	subscript on indicator panel
1	16-segment gauge of threat-type response levels	red	1
2	16-segment gauge of MOM-type response levels	blue	2
3	16-segment gauge of reflection levels	white	3
4	power-on led indicator	red	POWER
5	SEARCH mode indicator	yellow	SEARCH
6	AUDIO mode indicator	yellow	AUDIO
7	5 – segment tuning indicator*	yellow	TUNING
8	socket for control/power cable		CONTROL
9	USB-port		USB

* the TUNING segment bar has two functions:

- in the SEARCH mode, it shows the selected sensitivity of the receiver (SEN)
- in the AUDIO mode, it shows the selected frequency combination (CH 1..5)

The boresight directions of the receiving and transmitting antennas are shown in Fig. 5.

1.6.2. Main Unit

The main unit of ST 400 Cayman is housed in a durable plastic body (2, Fig. 2) fitted on top with a handle (5, Fig. 2) with three control buttons (15, Fig. 2). It has a battery compartment (3, Fig. 2) for two type 18650 accumulator batteries, closed with a metal cap (4, Fig. 2). On the left side of the main unit are a headphone socket (11, Fig. 2) and a power-and-volume knob (12, Fig.2), and on the right side there is a shield bearing the name of the device, its serial number, and the name of its manufacturer company (13, Fig. 2). Also on the right, a speaker grid can be found (14, Fig. 2).

The main unit's body hosts electronics controlling the device. For durability's sake, all the

components of the main unit are assembled on a single bearing structure made of metal, while the plastic body only serves protective and aesthetic purposes.

1.6.3. Telescopic Arm

The four-section telescopic arm is used to bring the antenna up close to remote objects under inspection. Its length can be adjusted with the aid of cam clamps (9, Fig. 2).

Its base section is anchored inside the main unit. The fore section of the rod is fitted with a bracket mount for the antenna module (6, Fig. 2). A lever handle (7, Fig. 2) is used to fix the antenna in a desired position.

A twisted cable goes through the arm, connecting the antenna with the power and control units housed in the main body. Fig. 6 shows the device with the arm retracted, and fully extended.

Fig. 6

1.6.4. Controls

Three control buttons are at the front of the handle (Fig. 7).

The mode-setting button (2, Fig. 7) is marked with an \square . A short press of this button alternates between SEARCH and AUDIO; holding it down for a few seconds will set the device to the ADAPT mode.

The other two buttons marked \triangle and ∇ (1 and 3, Fig. 7) are for tuning the device. Depending on the mode, they allow:
in the SEARCH mode, increasing and decreasing the receiver sensitivity, respectively.

in the AUDIO mode, setting the desired frequency combination

Fig. 7

2. USE

2.1. Preparation

Take the device and rechargeable batteries out of the case. Examine the main unit, antenna, cable and socket for mechanical damage. Examine the batteries for mechanical damage and electrode corrosion. Do not use the device if any such defects are found!

To replace the batteries, do the following:

- unscrew the battery compartment cap;
- insert two accumulator batteries as shown in Fig. 8, making sure you observe the polarity;
- screw the cap back in place.

Make sure the power switch (12, Fig. 2) is in the leftmost position (off). Connect the power-and-control cable plug (8, Fig. 2) to the socket on antenna module (8, Fig. 4). Switch on the device by turning the knob clockwise; the device status will be displayed on the antenna module as shown in Table 1 below.

Table 1

legend	colour	light indication	interpretation
POWER	red	continuous	The antenna module is powered properly.
		blinking	The battery is discharged and needs to be replaced.
TUNING SEN	yellow	continuous	This displays receiver gain. At startup the gain is automatically set to maximum, which is signalled by all the 5 indicator segments being lit.
SEARCH	yellow	continuous	This displays the operating mode. The SEARCH mode is selected automatically at startup.

Upon activation of the device one or more LEDs of the signal level gauge bars (1–3, Fig. 4) may light and go out spontaneously. This would mean that the device should need to be adjusted to the electromagnetic environment using the adaptive mode.

2.2. Adaptive mode

To activate this mode, press and hold for 3-4 sec the MODE button (2, Fig. 7) on the main unit control panel. The antenna must be directed away from large metal objects and anything that is presumed to contain nonlinear elements (it is often best to point the antenna at either the floor or ceiling).

The adaptation takes 10–15 seconds, with all the indicators but TUNING lit in the meantime on the antenna module. The TUNING indicator will be showing a consecutive lighting of segments. Meanwhile, the user can check if any of the indicator LEDs are dead.

Upon adaptation the device status will be displayed in accordance with Table 1.

2.3. Operational check with test dummies

Once ST 400 Cayman has been adapted to the environment, its functioning should be checked with the aid of test dummies that imitate nonlinear materials (1, Fig. 1).

For that purpose select an area free of responses from nonlinear elements or reflecting surfaces, and place there the dummy that is marked red.

Press button ∇ (3, Fig. 7) repeatedly to set the receiver gain at 3 lit segments of the TUNING indicator, which corresponds to medium sensitivity.

Point the antenna at the test dummy and find the distance at which all the 16 segments of the INPUT LEVEL Gauge bar 1 light up. For a device that is in proper working order and has self-tuned properly, this distance should be no less than 0.8 m.

Repeat the procedure using the dummy with the blue marking. In doing so, find the distance at which all the segments of the INPUT LEVEL gauge bar 2 will be lit. For a properly working device that has been adjusted to the environment, this distance should be no less than 0.3m.

If either distance is found to be smaller than the respective value above, it is advisable to engage the self-tuning routine anew (see 2.2) and repeat the checks as described above.

If both distances exceed the required minimums, the device is functional and operation-ready.

2.4. SEARCH Mode

Once ST 400 Cayman has been prepared and proven functional as described above in 2.1 – 2.3, it can be put to use. When activated, the device starts up in SEARCH mode, and the receiver gain is by default set to maximum, which is displayed by 5 lit segments of the TUNING indicator.

The SEARCH mode is the primary operation mode for ST 400. The operator can change the receiver gain at his discretion, thus increasing or decreasing the detection range.

The gain can be varied discretely with an 8dB increment, over 5 values in a 40dB range; each increment corresponds to one LED segment of the TUNING indicator. Thus, if all five are lit, the gain is equal to 40dB, providing maximum detection range. If all are dimmed, the gain is 0dB, with minimum detection range. The gain can be brought a step up or down by a single pressing of the TUNING buttons ∇ or \triangle (1 and 3, Fig. 7).

The antenna head should be held at a distance of 5-15 cm from the surface.

If a potent response is registered (all LEDs in an multi-segment LED gauge bar light up), the gain should be decreased in order to establish the exact location of the responding target.

The primary task for an NLJD is the discovery of eavesdropping devices, whose giveaways are the signals returned by semiconductor-containing electronic components and by MOM-structures on casings, at junctures, etc. Therefore, particular attention should be paid to scanned areas where responses have been observed on the red led gauge bar alone, and on both red and blue multi-segment LED gauge bars. The nature of each such response should be determined and its source identified.

A strong, off-scale response on one of the multi-segment LED gauge bars may be accompanied by a much weaker one on another. As a rule, the former is a true response and the latter a false one; it is advisable to decrease the gain or move away from the target until there is no off-scaling.

Small-sized objects should be checked at locations where no response is observed on any of the three INPUT LEVEL led gauge bars, preferably away from large metal structures, pillars, cabinets, safes, etc.

2.5. Listening (AUDIO mode)

The AUDIO mode is primarily intended for analysing target responses by listening to the demodulated signal output. This should give the operator ample information to identify the response type.

To switch from SEARCH to AUDIO, press . The SEARCH led (5, Fig. 4) on the antenna head will then go off, and AUDIO led will light up (6, Fig. 4).

When the AUDIO mode is on, the device status will be displayed on the antenna module as described in Table 2 below.

Table 2

legend	colour	light indication	meaning
POWER	red	continuous	The antenna module is powered properly.
		blinking	The battery is discharged and needs to be replaced.
TUNING	yellow	continuous*	The 5-segment bar displays the selected probing frequency combination.
AUDIO	yellow	continuous	AUDIO mode on.
INPUT LEVEL 3	white	varying numbers of lit LEDs	The 16-segment bar displays the levels of returned signals. Note: in the AUDIO mode this gauge bar shows a sum total of responses, regardless of their type.

*Upon switching to AUDIO, none of the TUNING bar segments are lit, which corresponds to #0 frequency combination.

The ST 400 Cayman NLJD makes it possible to listen to demodulated signals while probing with six different frequency combinations. Each combination, indicated by LEDs on the

TUNING bar, is suited to deal with a particular category of nonlinear objects. Upon activation of the AUDIO mode, frequency combination #0 is set by default; it is meant for probing semiconductor content and, as a rule, gives good results in identifying active radio-transmitting and sound-recording devices.

Frequency combination #1 is used to analyse return signals from MOM (metal/oxide/metal) structures.

The remaining four combinations are auxiliary. Their use is advised when responses have been observed in the SEARCH mode on the red INPUT LEVEL bar, yet probing with combination #0 has rendered no definitive findings.

Table 3 shows correspondence between frequency combinations and responses observed in the SEARCH mode.

Table 3

	indication on TUNING bar					
						
freq. combination #	0	1	2	3	4	5
gauge bar # in SEARCH mode	1	2	1	1	1	1

Use buttons ∇ and \triangle to change probing frequency combinations (1 and 3, Fig.7).

Table 4 shows typical results of analysing targets with nonlinear properties.

Table 4

Type of probed target	Optimum frequency combination	Sounds when subjected to mechanical impact or test sound	Sounds in the absence of mechanical impact or test sound
MOM-structure	1	crackling, creaking	none
active electronic devices (unencoded transmission channel)	0 (2-5)	audible response to tapping or test sound	sounds of the environment

active electronic devices (encoded transmission channel)	0 (2–5)	peculiar signals caused by the operation of the device and independent of sounds in the environment	peculiar signals caused by the operation of the device and independent of sounds in the environment
inactive electronic devices	0 (2–5)	none	none
active electro-mechanic or mechanic appliances	0-5	crackling, creaking	peculiar signals caused by the operation of the device and independent of sounds in the environment

When listening to demodulated signals, it is recommended to use headphones. Sound volume is adjustable with a variable resistor (12, Fig. 2).

Recommendations

Any response observed on the red bar (or on both red and blue bar simultaneously) should be analysed in the audio mode with the use of a test sound source. If a response has been observed on the blue bar, it is advisable to perform audio analysis with the frequency combination #1, subjecting the target area to mechanical impact (tapping). While probing, it is advisable to change gradually the distance between the antenna and target within 5–100 cm range.

Push **M** to switch from the AUDIO mode to SEARCH.

2.6. Program Updates

ST400 Cayman has a processor that operates in accordance with the program firmware that is pre-installed by the manufacturer company. Over time the firmware gets refined and newer versions get released, that can be installed through the USB port.

‘What is my firmware version?’

In order to find out what firmware version is currently installed on your ST400, set it to SEARCH, then press **△** and hold it for 3 seconds. The three INPUT LEVEL bars (4, 5 and 6, Fig. 4) will light up, with the number of lit LEDs indicating the current version in the format ‘R.B.W’ (red, blue, and white). For example, if 1 red, 2 blue, and 5 white LEDs are lit up, then the current version is 1.2.5.

Press any button to exit this mode.

Firmware update procedure

The newest firmware version, with issues sorted out or features added, can be downloaded from <http://spymarket.com/> ('ST 400 CAYMAN' section) and installed through the USB port with the installer enclosed with the update files.

In order to update the ST 400 Cayman firmware, do the following:

- turn off the device (if activated)
- using a thin object, open the USB socket cover on the antenna panel (9, Fig. 4)
- connect ST400 Cayman to the computer using a USB cable
- turn on the device
- when the POWER led (4, Fig. 4) lights up, within 5 seconds briefly press \triangle ; after 5 seconds the power-on LED will go dim to indicate that the device is now in the updating mode
- turn off the device
- follow instructions in the README file that comes with the update.

WARNING! Once the updating process has started, ST 400 Cayman can only be switched into operation again upon completion of the update installation.

3. POWER SUPPLY

ST 400 Cayman is powered by two Li-ion rechargeable batteries (type 18650). 4 batteries are included in the delivery package. The total run time on one battery charge is from 3 to 4 hours, depending on the modes employed; the most demanding in terms of power consumption is the AUDIO mode.

The batteries are housed in the battery compartment at the back of the main unit. Battery replacement is described in 2.1 above.

ST 400 Cayman monitors its battery charge status. A continuously lit power-on led (4, Fig. 4) on the antenna head means that the battery charge is sufficient. A low battery charge will be signalled by blinking of the power-on LED and a warning sound. If the charge goes below the critical threshold, the device will switch off automatically.

Accumulator batteries can be charged with the charger included in the delivery package. The charging time of a fully discharged battery is 3 hours. As these batteries are free of memory effect, incomplete charging is acceptable, but the running time will then be shorter.

The following is not allowed:

- long-term storage of discharged batteries
- long-term storage of batteries at low temperatures
- short-circuiting battery contacts
- subjecting batteries to strong shock
- transportation of the device with an installed battery.

4. OPERATING RESTRICTIONS

Use of the device is subject to safety regulations for equipment incorporating UHF transmitters. The following must be observed at all times:

- Avoid long exposure of people to the antenna beam (the main lobe of the polar diagram) at distances less than 1m.
- Do not point the antenna at people's eyes at distances less than 1m.

If the device has been transported at temperatures well outside the service temperature range, make sure to keep the device indoors at service temperature for 2 hours before use.

5. STORAGE AND TRANSPORTATION

The device must be stored in heated storage facilities pursuant to GOST V9.003–80 (ГОСТ В9.003–80). The following conditions must be maintained:

- 1) ambient temperatures from + 0 to 50°C;
- 2) relative air humidity 80 percent at 30°C;
- 3) atmospheric pressure from 630 to 820 mmHg;
- 4) absence of acidic, alkaline, or other aggressive vapours.

The device can be transported in standard packaging by any suitable means of conveyance (in a pressurised module, if transported by plane) as long as it is protected from atmospheric moisture. While transporting the device, avoid dropping or otherwise subjecting it to strong impacts. During transportation, the mechanical conditions must comply with medium level requirements per GOST B20.57.310–76, while the ambient conditions must correspond to those specified by GOST B9.003–80 for open-air storage.

6. WARRANTY

The manufacturer guarantees compliance of every manufactured item with all the requirements as per technical specifications, within 12 months of the date of purchase.

During the warranty period, the manufacturer guarantees free of charge repairs of the device, its auxiliary components and accessories, up to full replacement.

Free repairs or replacement can only be claimed if the user has observed all the rules of operation, transportation, and storage of the device, and on condition that the device itself and its ancillary parts are free from mechanical damage, and upon submission of a properly filled out warranty coupon.

Upon expiry of the warranty period, post-warranty servicing is available from the manufacturer. The warranty does not cover batteries.
